

This publication provides guidance and doctrine for the Tactical Record Traffic System (TRTS). It provides signal and nonsignal personnel an overview of the TRTS. It gives the reader necessary procedures to standardize operations when processing, transmitting, and delivering tactical record traffic in hard copy and soft copy format. (Hard copy is printed copy; soft copy is data stored on magnetic disks.) This publication covers tactics, techniques, and procedures for operating various TRTS subscriber terminals. It also provides information on the evolution of the record traffic communications system towards a totally integrated, automated, and synchronized communications system. Record traffic is the term for messages that are permanently or semi-permanently being maintained by the message originator or addressee. Record traffic is used primarily by staff organizations to conduct unit business and may exist in page form or reside on floppy disks or within computer memory. With the advent of the TRTS, users of the TRTS can process record traffic communications within an automated, decentralized, highly mobile and extended communications environment far removed from the older over-the-counter record communications services provided by the Signal Corps. In this TRTS architecture, record traffic subscriber terminals are user-owned, user-deployed, and user-operated.
